

Negar Team

Web Design System and Agent Guide

A site-grounded specification for the Negar Map and the AI agents who maintain it.

Core rule

Keep the question visible. Let the work take the form it needs. Preserve the evidence behind every claim.

LIVE REVIEW · VERSION 3.0 · 30 SEPTEMBER 2026

Reviewed at negar.team on desktop. The site's structure, visible copy, map perspectives, and selected states were inspected. Exact CSS values, mobile layouts, keyboard behavior, reduced-motion behavior, contrast ratios, and performance were not measured in this review.

How an AI agent should read this document

This guide records the current public site as observed on 30 September 2026. It separates visible facts from implementation advice so an agent can preserve the live experience without treating unknown details as facts.

Marker	Meaning	How to act
OBSERVED	Visible on the current public page or exposed in its accessibility tree.	Preserve unless the user asks for a change. Recheck public copy before publishing.
RECOMMENDED	A design or engineering rule for future changes.	Apply when it fits the repository architecture and does not contradict code or a newer instruction.
VERIFY	Not measured or not available from this review.	Inspect the source, tests, and rendered state before making a claim or hard-coding a value.
Source order Follow the nearest applicable AGENTS.md first, then current source code and project data, then this guide. Treat the live site as evidence of what is visible today, not as proof of implementation details.		

First pass for any agent

- Read AGENTS.md files from repository root down to the files you will edit.
- Check git status before changing files. Find the actual app entry points, project data, asset folders, and package scripts.
- Trace the selected content and interaction state before changing layout or data.
- After an edit, run the repository’s existing relevant checks and inspect the page at narrow and wide sizes.

Review items to verify

The perspective options appear exclusive, but the accessibility tree exposed checkbox roles; confirm single-selection semantics and keyboard behavior. Secondary text looks pale in the capture, so measure contrast. Test mobile layout, focus, screen-reader names, reduced motion, and overflow.

The Negar Map is a narrative, not a catalogue

OBSERVED. The page opens with “Some things begin as products. Some begin as questions.” It frames Negar as the place where the team finds out which is which. The main visual thread connects questions to current forms of work; pauses and annotations provide editorial rhythm.

Page order	Current role	Visible content
Hero	State the thesis and invite entry.	Field Notes 001 — Ongoing; “Enter the map”; “No master plan / Just a recurring question.”
01 · There was no master plan	Explain the habit behind the work.	“When something doesn’t make sense, investigate it.”
02 · Current questions	Show four question-to-project relationships and one honest unknown.	Products / Questions / Systems perspectives.
System interrupt	Pause to question whether the problem is being solved.	“Are we solving the problem, or merely making the existing solution more sophisticated?”
03 · Constraints we choose	Make operating constraints tangible.	Understandability, Agency, Local Control, Earned Complexity, Infrastructure, Trust, Experimentation.
04 · The Negar test	Show how a prompt is evaluated.	Current item: “It uses AI.” Current read: “irrelevant”.
05 · Forms the work can take	Classify work by role.	Products, Infrastructure, Research, Experiments.
Margin note and close	Add a personal note, then return to the Negar thesis.	“I don’t get bored easily. I get bothered when things don’t make sense.”
Review boundary This review used a desktop browser and the page’s accessibility tree. It confirms content and visible behavior, not source CSS, mobile behavior, keyboard operation, WCAG conformance, loading speed, or reduced-motion support.		

What is working

The hero states the point of view quickly. The map keeps question, project, status, and destination together. The unknown node remains honest, and later sections develop the same thesis.

Keep each relationship factual and editable

OBSERVED. The map has four current question nodes. Preserve the project name, prompt, short description, status, and destination as separate fields. The descriptions below are current public copy, not a permanent product specification.

Node	Question	Current form and status
01 · Documents	Why does information stop being useful just because someone put it inside a PDF?	GlyphMend · Available
02 · Markets	What happens when the information you need is fragmented, inconsistent, and controlled by multiple sources?	Synthora · Available
03 · Context	Why does our context disappear every time we change tools or devices?	Ariadne · In progress
04 · Files	Can an archive be useful without asking you to install another dependency first?	SmartPack · Available
Project	Current public description	Current destination
GlyphMend	A local-first PDF reconstruction workspace that turns documents into structured Markdown and DOCX while preserving evidence and surfacing uncertainty.	glyphmend.negar.team
Synthora	A browser-first investment planning tool that makes its inputs, calculations, assumptions, and uncertainty visible.	synthora.negar.team
Ariadne	A local-first context continuity platform that preserves the factual thread needed to return to interrupted digital work.	github.com/tahamoeini/ariadne
SmartPack	A lossless Ubuntu archiver built on Python's standard library, with adaptive packing, integrity checks, and defensive extraction.	github.com/tahamoeini/smartpack
Do not invent Before changing a project description, status, or link, check the project's official repository or site. Do not invent users, outcomes, capabilities, metrics, dates, architecture, ownership, or release state. Keep UNKNOWN_05 unresolved until a real question is approved.		

Editorial type, quiet routes, clear nodes

OBSERVED. The current page combines large clean sans-serif headlines with expressive italic serif phrases and serif question prompts. Product names and body descriptions use a readable sans-serif. Small numbered labels and system annotations use a compact monospaced style. Exact font family names were not verified.

Role	Observed treatment	Agent rule
Hero thesis	Large sans-serif first statement; italic serif emphasis on the question line.	Preserve the contrast between statement and question. Keep the line breaks deliberate and responsive.
Question prompt	Large serif text within each map branch.	Give the question visual priority over its current product.
Section heading	Large, clean sans-serif.	Use clear plain language; avoid turning every heading into a slogan.
Project name and body	Sans-serif name and compact descriptive copy.	Maintain readability and distinct visual hierarchy.
Metadata	Small uppercase or tracked technical labels; numbered nodes.	Use sparingly for section numbers, statuses, and map details. Never use it for long reading text.
Margin note	Short personal copy with quieter editorial treatment.	Keep subordinate to the question and map.

Color and surfaces

OBSERVED. The desktop capture shows a warm paper canvas, deep blue-green ink, subdued gray route and text, and a restrained warm ochre accent on small map marks and labels. The System Interrupt shifts to a slightly darker neutral surface. Exact color values and contrast ratios were not measured; resolve these roles to source tokens and do not reuse unverified legacy hex values.

Semantic role	Use	Implementation source
Paper	Main reading canvas.	VERIFY: read the site stylesheet or design tokens.
Ink	Headlines and essential copy.	VERIFY: read the site stylesheet or design tokens.
Thread	Quiet route and inactive map structure.	VERIFY: read the site stylesheet or design tokens.
Accent	Small node, section index, selected-state underline.	VERIFY: read the site stylesheet or design tokens.
Interrupt surface	A restrained tonal pause in the route.	VERIFY: read the site stylesheet or design tokens.

Three perspectives on one map

OBSERVED. The selector is labeled “View this map as” and offers Products, Questions, and Systems. The initial state is Questions. Selecting another option keeps the four question-to-project branches in place while changing emphasis and the current-form metadata.

State	What the mode emphasizes	Current project metadata examples
Questions	The domain and original problem.	QUESTION / DOCUMENTS · QUESTION / MARKETS · QUESTION / CONTEXT · QUESTION / FILES
Products	The current project form.	PRODUCT / GLYPHMEND · PRODUCT / SYNTHORA · PRODUCT / ARIADNE · PRODUCT / SMARTPACK
Systems	The concerns behind each project.	Document reconstruction · local processing · structured knowledge; multi-source market data · decision support · local-first planning; context continuity · local storage · human-tool interaction; adaptive compression · integrity verification · dependency-free tooling.

Negar Test

OBSERVED. The page presents one prompt at a time and exposes a “Next condition” button. The current visible state is question 01 of 05: “It uses AI.” with the read “irrelevant”. Preserve the short, non-performative format. Do not guess the unseen four prompts or responses; inspect the data in source before changing the sequence.

Required interaction behavior

- Keep every perspective available without motion. Use one selected state at a time and expose it to assistive technology.
- Keep interactive labels visible and use native controls where possible. If the selector is exclusive, test a radio group or equivalent single-selection pattern.
- Keep focus visible, hit areas usable, and link destinations clear. Keyboard users must be able to change perspective and advance the Negar Test.
- For reduced motion, remove route drawing and spatial transitions while retaining the full route, current perspective, and all copy.

Let the route adapt to the reading order

RECOMMENDED. Preserve the spacious desktop editorial composition, then make the mobile map a clear vertical reading path. Keep the question, project, status, and link together at every width.

Viewport target	Layout direction	Acceptance check
360 px	Single-column route; compact but readable section labels.	No horizontal scroll. No clipped node, label, project name, or action.
768 px	Transitional layout; keep question and project relationship obvious.	Do not compress long questions into narrow columns.
1280 px	Editorial two-column relationships with space for the route.	Maintain reading width and line lengths.
1440 px and wider	Stable content width; extend the map canvas only when useful.	Avoid stretching body text across the entire screen.

Layout principles

- Use the repository's existing spacing, grid, and breakpoints when present. Do not introduce a second token system.
- Prefer CSS grid and normal document flow; position SVG behind or beside content without changing reading order.
- Make the SVG decorative to assistive technology only when equivalent semantic text and links are present.
- Check Persian or mixed-script content with proper shaping, direction, punctuation, and brand-name handling if localization is added.

A safe path from edit to review

Step	Agent action
1 · Orient	Read repository root and nested AGENTS.md files. Inspect git status, app entry points, source assets, content records, and existing scripts.
2 · Trace	Find the exact component, token, content record, and state used for the requested change. Prefer editing the single source of truth.
3 · Change	Make a focused update. Reuse existing components and libraries. Keep the approved logo files unchanged; avoid dependencies for cosmetic effects.
4 · Verify	Run the relevant scripts discovered in package.json or project documentation. Do not claim tests passed unless they ran.
5 · Inspect	Review screenshots at 360, 768, 1280, and 1440 px when the environment supports them. Check content, line breaks, route placement, focus, interaction, contrast, and overflow.
6 · Report	Summarize files changed, verification performed, any checks that could not run, and factual claims that still need confirmation.

Release checklist

- The question remains the primary unit; its project and system concern stay linked.
- All project names, descriptions, statuses, and external destinations are verified.
- The perspective selector exposes its active value and is keyboard operable.
- System Interrupt remains a deliberate pause in the story and route.
- The unfinished node remains explicit until a real item is approved.
- The logo and independent product identities are preserved.
- Responsive reading, reduced motion, semantic text, visible focus, contrast, and external links have been checked.
- Build, lint, tests, or type checks match the project's actual scripts and results.

Before deployment

A change to public content or layout does not authorize publishing. Follow the repository's release process and only deploy when the user explicitly asks for it.

Semantic tokens before numeric guesses

The machine-readable companion records visual roles observed on the live page and marks exact values as unverified. When working in the site repository, map these roles to existing CSS custom properties. Update the guide only after checking the source values and contrast.

Token role	Meaning	Value status
surface.paper	Main warm-neutral canvas.	Visual role observed; source hex not inspected.
surface.interrupt	Slightly darker tonal pause.	Visual role observed; source hex not inspected.
text.ink	Primary heading and essential copy.	Visual role observed; source hex not inspected.
map.thread	Quiet connective route.	Visual role observed; source hex not inspected.
accent.warm	Small route node and section marker.	Visual role observed; source hex not inspected.
type.display / type.question / type.body / type.meta	Sans display with serif question emphasis and compact monospaced metadata.	Roles observed; exact families not inspected.

Current copy anchors

- “When something doesn’t make sense, investigate it.”
- “Are we solving the problem, or merely making the existing solution more sophisticated?”
- “Would Negar build it?”
- “I don’t get bored easily. I get bothered when things don’t make sense.”
- “Negar is not a collection of products. It’s a way of looking at problems.”

Treat this as a maintenance guide, not an approval of every implementation detail. Re-review the live site after substantial changes and revise the observed/recommended/verify markers.
